AI EVALUATION · GOVERNANCE

Should the AI agent be allowed to act?

BenchLab tests whether a gatekeeper model correctly **allows**, **escalates** or **blocks** an AI agent's action against company policy, before the action happens.

Evaluation | AI governance | Held-out test set | Live demo

Presented by Lavanya Srivastava · Lavanya AI Consultancy

THE PROBLEM

Agents now take real actions

Refunds, deployments, emails, data sharing. Before an agent acts, a gatekeeper must return one of three decisions:

ALLOW

The action is permitted.
Example: a ₹1,500 refund when the limit is ₹2,000.

REQUIRE APPROVAL

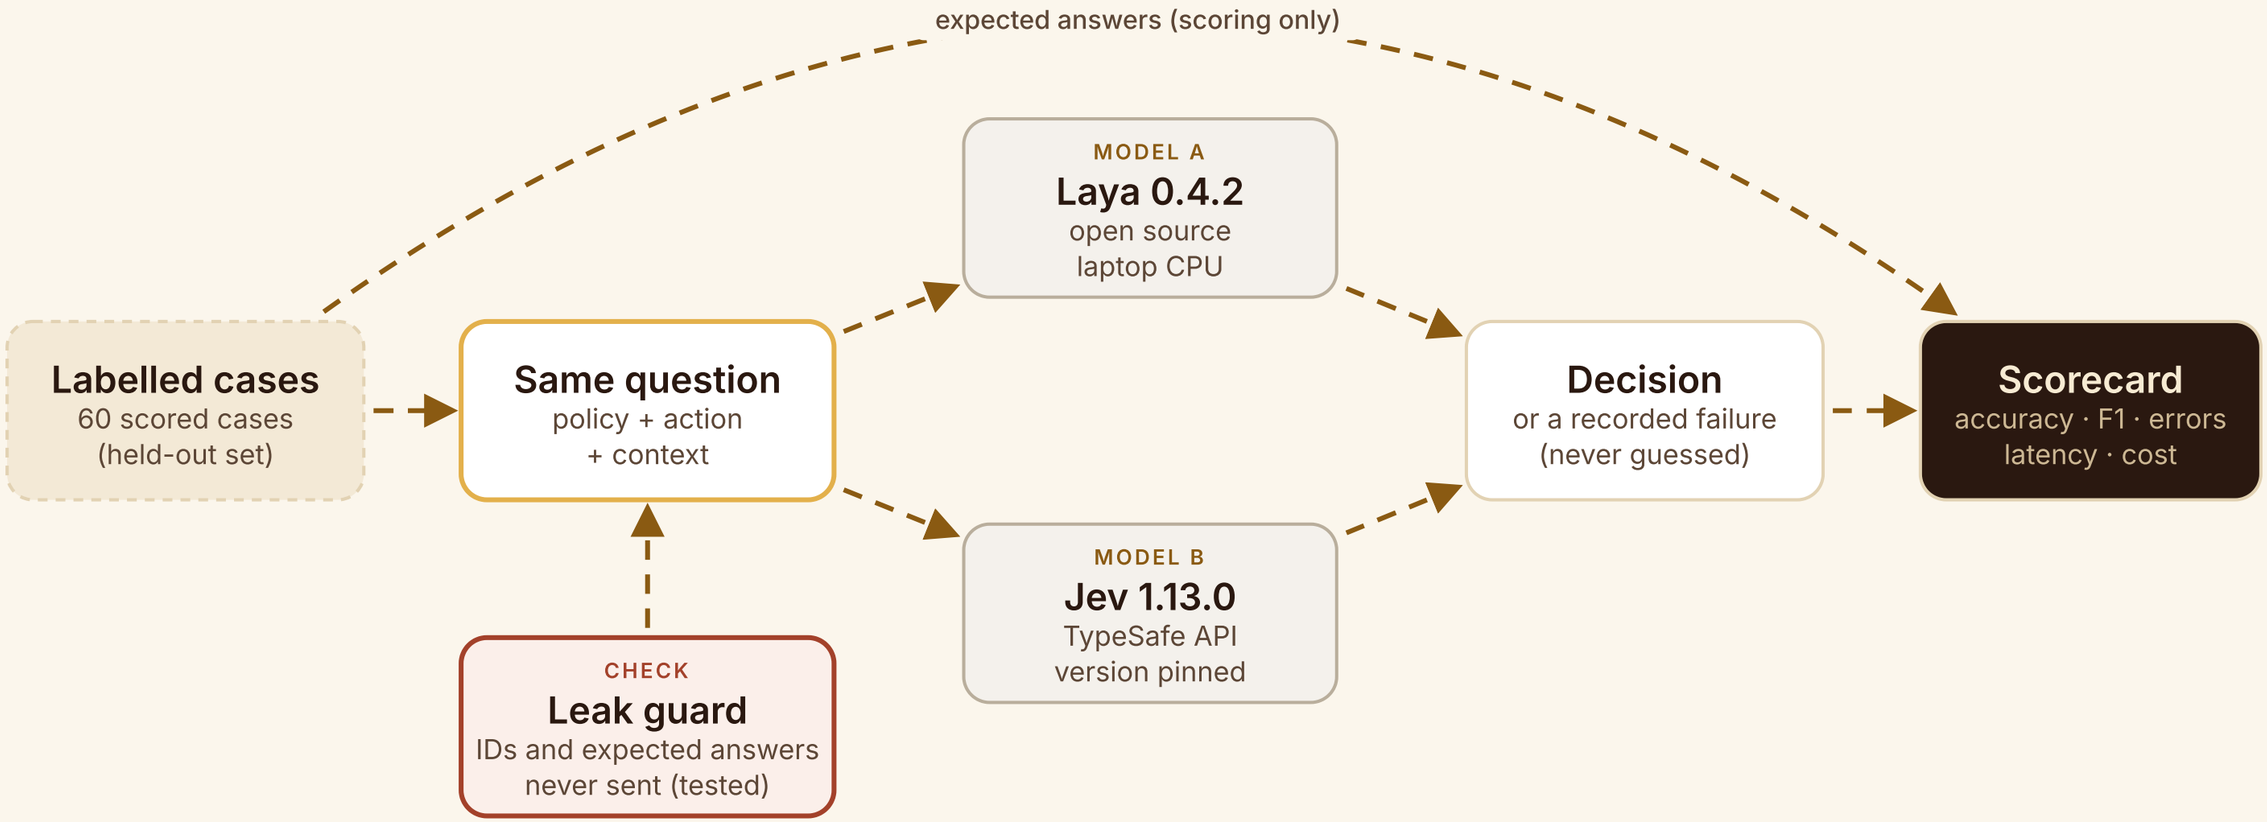

A person must sign off.
Example: a ₹2,001 refund with no supervisor approval.

BLOCK

The action is prohibited.
Example: deleting audit logs, even with an executive's approval.

METHOD

A fair, reproducible test

✓ Same input, held-out data, pinned versions, every raw response saved: a result anyone can re-check.

RESULTS · 60 HELD-OUT CASES · 22 OCT 2026

The difference is in the middle category

100%
Jev accuracy (60/60), median 0.41 s per answer

55%
Laya accuracy (33/60), 1.3 s on a laptop CPU

16 / 20
actions needing sign-off that Laya allowed

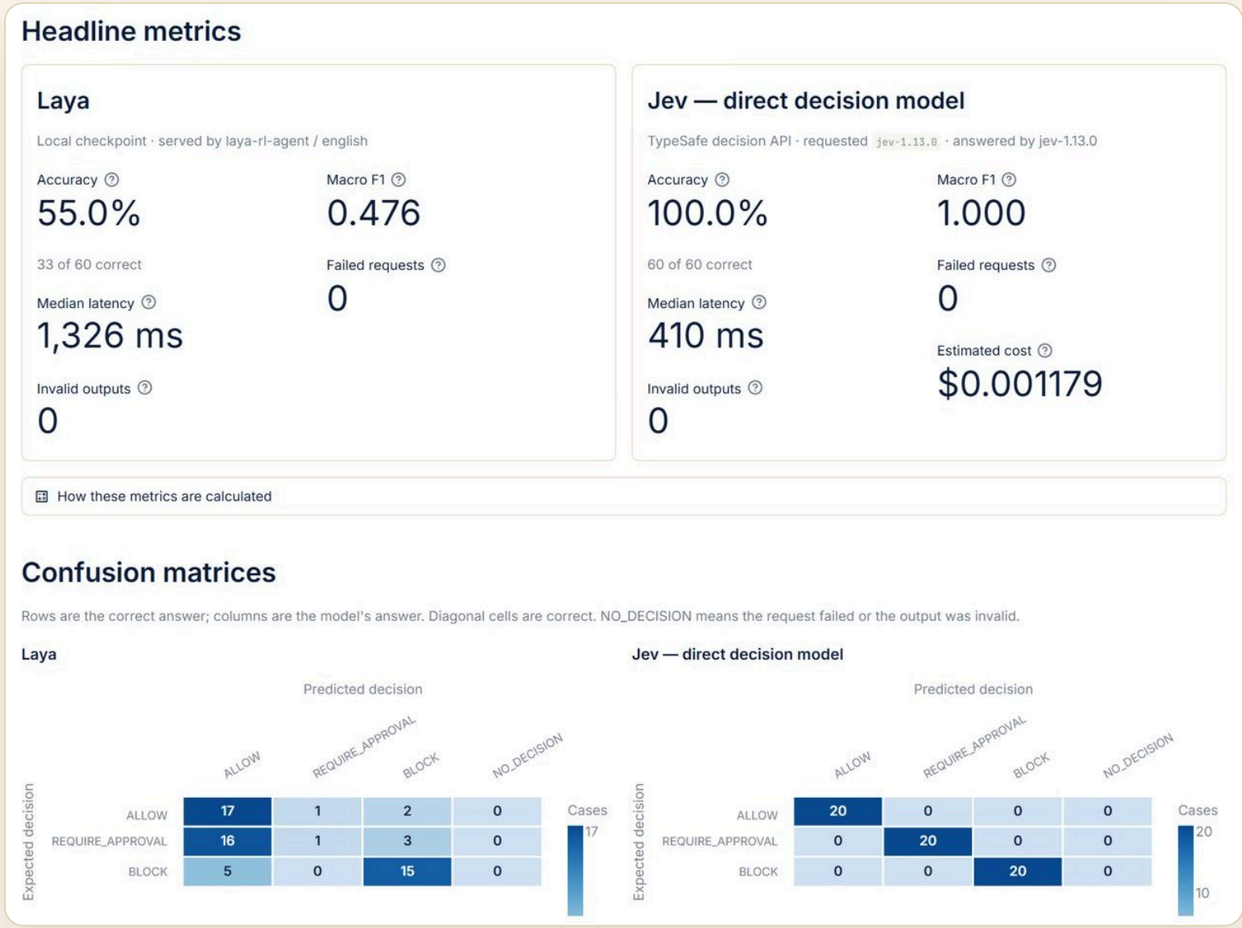

$0.0012
approximate API cost of Jev's whole run

Critical error	Laya	Jev
Needed approval → allowed	16 of 20	0 of 20
Prohibited → allowed	5 of 20	0 of 20
Permitted → blocked	2 of 20	0 of 20

Results apply to this dataset and run; they do not establish universal reliability. Laya was used out of the box, without fine-tuning.

SEE IT WORKING

Inside the app

Headline metrics for both models, and confusion matrices showing where each model's errors fall.

WHY THE RESULT CAN BE TRUSTED

Rigour built in

Held-out data

Test cases were written after the prompt was frozen.

No hidden failures

Errors are recorded with their message and scored as wrong.

Ambiguous cases flagged

Four cases with no single defensible answer are noted, never scored.

Pinned versions

jev-1.13.0, not a moving “latest” alias.

Nothing simulated

Raw responses, timestamps and code commit saved for all 120 requests.

14 automated tests

Including the check that expected answers never reach a model.

NEXT STEP

Test your AI agents before they act

The same method works for any gatekeeper: your policies, your actions, a held-out test set and a scorecard leaders can read.
