VOICE AI · CONTACT CENTRES

Real-time voice AI for phone calls

Twilio streams live call audio, **Deepgram** turns it into text while the caller is still speaking, and an LLM writes a structured **call report**.

Twilio · WebSockets · Deepgram · FastAPI · OpenAI

THE PROBLEM

Voice is the hardest channel to automate

Speed matters

A voice bot must hear words within a second or the conversation feels broken.

No record

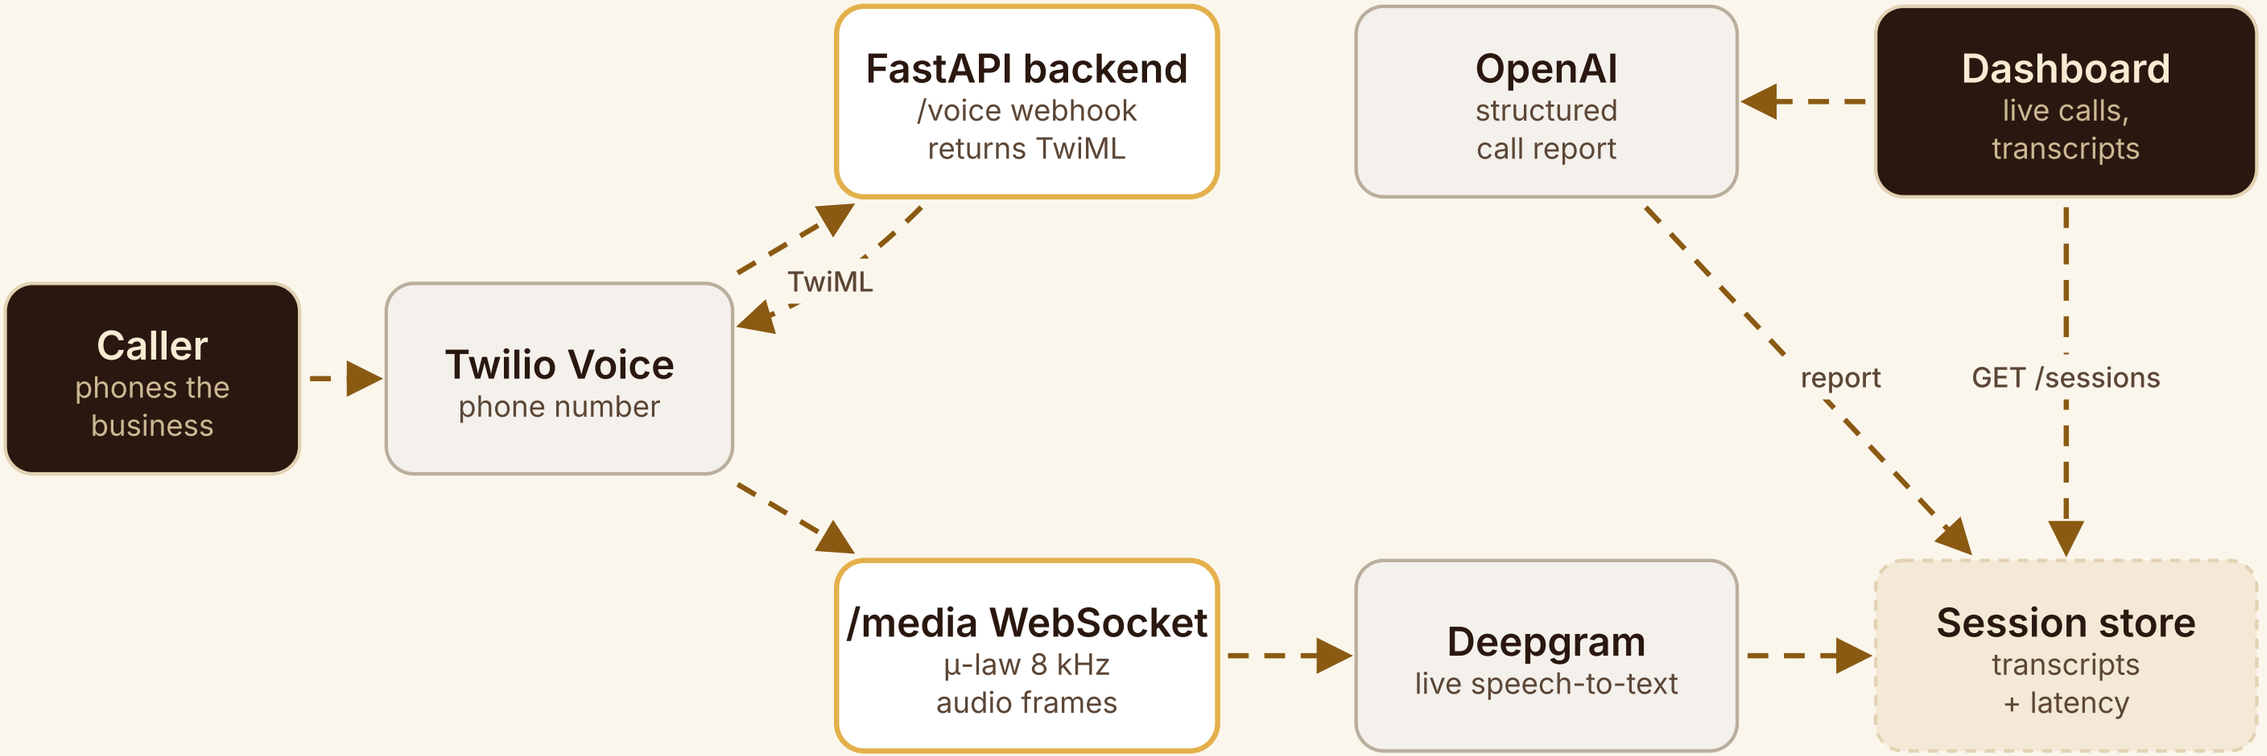

Without a live transcript, supervisors cannot see what happens on a call.

Manual wrap-up

Agents spend minutes after each call writing summaries by hand.

ARCHITECTURE

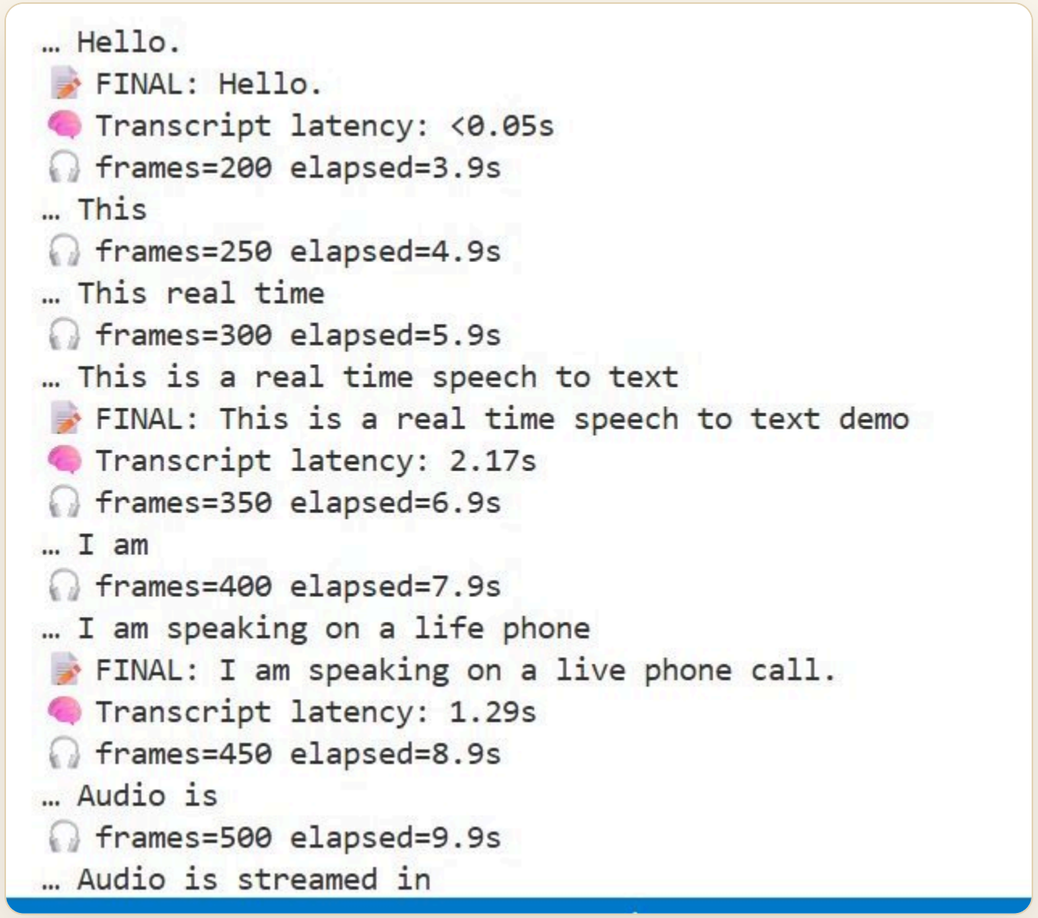

From a phone call to a call report

✓ Phone audio → live transcript → measured latency → AI call report: the foundation for voice agents.

SEE IT WORKING

A live test call

Console during a call: interim text, FINAL transcripts and transcript latency for each sentence (for example 1.29 s).

WHERE IT STANDS

Honest status

Built and tested

Live Deepgram streaming, latency measured on every call, LLM call reports, and unit tests for the transcript logic.

Deployable

FastAPI backend with a Render configuration and /health check; Streamlit monitoring dashboard.

Next: persistence

Sessions are kept in memory today; a database is the next step.

Next: human handoff

Transfer to a person when the caller asks for one.

NEXT STEP

Add voice to your customer experience

Live transcripts for supervisors, automatic call summaries, and the base for a voice assistant that answers routine calls.
