ENTERPRISE AI AGENTS · SECURITY

A workplace assistant that respects permissions

An **Azure AI agent** schedules meetings and drafts emails through custom **MCP tools**, and every action passes a role check and a personal-data scan first.

Azure AI Foundry | MCP | Role-based access | PII protection

Presented by Lavanya Srivastava · Lavanya AI Consultancy

THE PROBLEM

Agents that act need limits

Too much access

An assistant that can email anyone, on anyone's behalf, is a security incident waiting to happen.

Data leaks

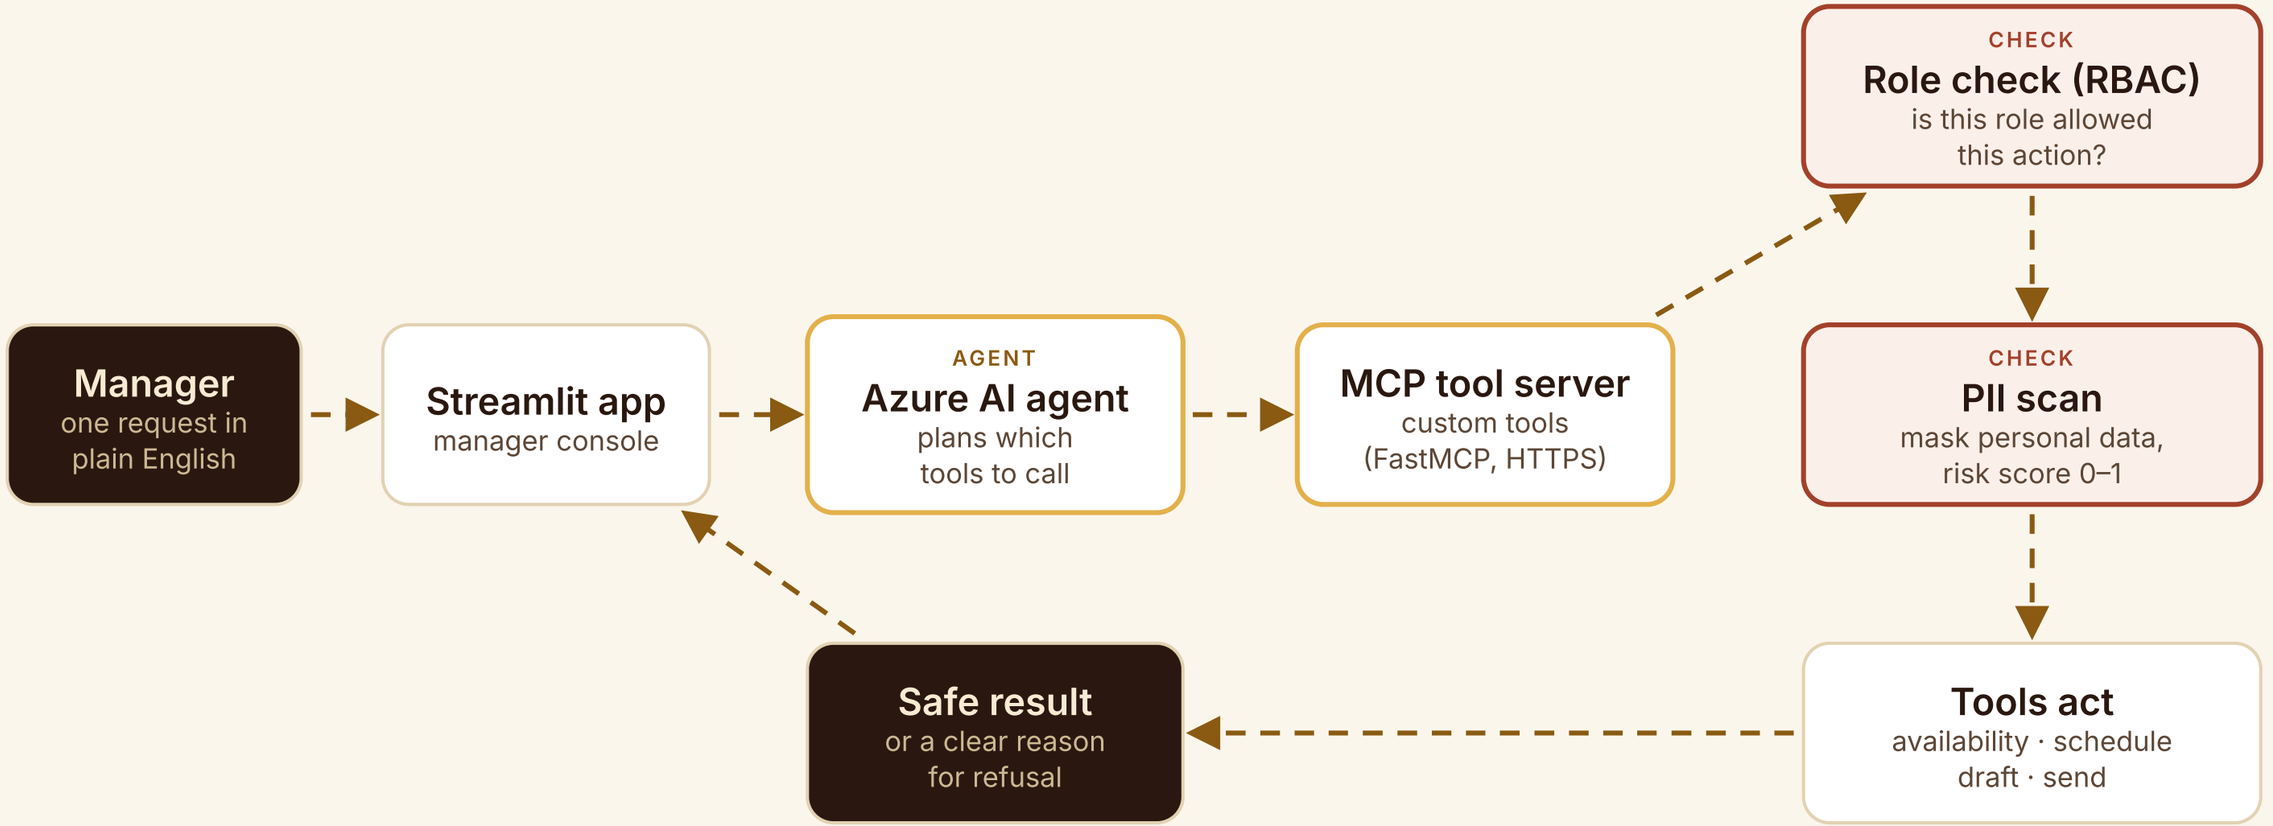

Phone numbers, PAN, Aadhaar and card numbers slip into emails unnoticed.

No control

Companies need to decide who may do what, and see why an action was refused.

ARCHITECTURE

Every tool call is checked

The agent plans, the tools act, and every action passes permission and privacy checks first.

ROLE-BASED ACCESS

Who may do what

Action	Employee	Manager	HR admin
Schedule a meeting	Yes	Yes	Yes
Draft an email	Yes	Yes	Yes
Send an email	No	Yes	Yes
Access sensitive data	No	No	Yes

Rules live in one place in the MCP server, so a company can change them without touching the agent.

REAL OUTPUT OF THE GUARDRAIL CODE

What the checks return

EMPLOYEE SENDS	`send_email` → refused: “Role 'employee' cannot perform 'send_email'.”
EMAIL TEXT	“Please call Ravi on 9876543210 or write to ravi.k@example.com”
PII SCAN	Masked: “Please call Ravi on [PHONE] or write to [EMAIL]” · risk **0.35** → may be sent
CARD NUMBER	“Refund to card 4111 1111 1111 1111” → risk **0.90** → sending **blocked**

Sensitivity weights: email 0.2 · phone 0.3 · PAN 0.6 · Aadhaar 0.85 · card number 0.9, plus 0.05 for each extra item found.

NEXT STEP

Internal AI assistants your security team will approve

Scheduling, HR communications, incident coordination and customer triage, with permissions and privacy enforced in the tools themselves.
